注意阻尼加大时,幅频相频曲线的变化

频域和时域的测试之间是有关联的：
频域过0分贝的频率必然可以在时域的阶跃响应中有体现。

阻尼大对系统稳定有好处，但阻尼在机床上主要与摩擦相关，摩擦大导致过象限不好控制，另动静摩擦系数差别大导致“爬行”

另外，一种优化方式成为阻尼优化（Damping Optimization），即速度设定值是考虑负载的状况。

速度环的PI调节器相当于弹性+阻尼环节，描述的是速度设定和电机之间的关系。
 如果Kp大TN小，则电机完全按速度设定值运转，但负载会怎么响应。这种优化称为干扰最优优化(Disturbance optimization)。如对于皮带轮传动的冲击干扰。

Transfer function open loop: $F_o(j2\pi f) = \frac{Y(j2\pi f)}{E(j2\pi f)}$
开环传递函数

Transfer function closed loop: $F_w(j2\pi f) = \frac{Y(j2\pi f)}{W(j2\pi f)}$
闭环传递函数

$$F_w(j2\pi f) = \frac{F_o(j2\pi f)}{1 + F_o(j2\pi f)}$$

$$F_o(j2\pi f) = -1: \quad F_w(j2\pi f) = \infty$$

如果开环的频率响应，幅值在0dB，相位为±180度，则闭环的响应就是不稳定的。

$$F_w = \frac{F_o \cdot E}{W} = \frac{F_o \cdot E}{(F_o + 1) \cdot E}$$

because $W - Y = E$
at summary point
so $W - E = Y = F_o \cdot E$
and $W = (F_o + 1) \cdot E$

电流环框图

P1810.11 Current controller dynamics higher

当电机电流增大后, 电机电感因电流饱和会降低, 根据前面的结论, 电流环的增益也要随之降低。
问题是何时降低, 降低多少。电流环的增益与电机电感成正比

电流环适应

为什么不能过0dB?

Industry Sector

Speed and Position Controller

速度和位置控制器

Speed Feed Forward

Acceleration Limitation

Jerk Limitation

Assessment of Accuracy at Axes with different Dynamics (Circular Test)

蓝色曲线是电流环频率响应，红色曲线是speed control plant响应,两者相乘在伯德图上是相加（叠加）得到棕色的速度环开环频率响应。根据前面的奈奎斯特判据，要想闭环稳定，开环幅值在0dB时，相位不能等于180度。故有幅值裕量和相位裕量概念。

速度开环频率响应曲线，当幅频曲线穿越0dB的频率，对应相位距离180度多远，即相位裕量
提高增益,幅频曲线向右上方移动,相位裕量减小

at Axes with different
Dynamics (Circular Test)

Overview of the
Procedure of an
Optimization

同理，当相位在180度的频率对应幅频曲线距离0dB多远，即幅值裕量

幅值裕量 > 6dB, 相位裕量 > 30度 闭环可以保证是稳定的。接近动态性能更好；更大裕量，更稳定。

Nyquist criterion : Used in bode diagram

奈奎斯特判据：在波德图中使用

Introduction to
mechanical System
Dynamics

Speed and Position
Controller

速度和位置控制器

速度环的增益与惯量成正比。所以，为什么有大惯量电机：惯量大 \rightarrow 增益大 \rightarrow 阻尼好 \rightarrow 更好的对干扰的响应。缺点：加速慢。

125 μ s周期：1200*J

62.5 μ s周期：2000*J pwm开关频率相同，故没有达到两倍

	Disturbance optimization		Damping optimization
Kp	10	10	2
Tn	6	6	30
Reference model	60	0	0
Kv	0.8	0.4	1.5

机械系统的伯德图与前面速度环的伯德图叠加,如果正好下凹与尖峰幅值相同,则在0dB,这是damping optimization的速度环设定.如果传动部件自锁,则无法实现,这时需要用APC,利用直接反馈将速度/加速度反馈回速度环

如果使用damping optimization, 可将Kp降低5倍, Tn增加5倍, 进行测试。

两种选择: Disturbance optimization 大Kp小Kv ; Damping optimization 小Kp大Kv

如果有干扰靠近电机侧Damping optimization可能不合适; 另外也要看其它轴是否能匹配。

在nset,corr这一点，正常路径和 DSC路径相同，值相反，故抵消了。旁边一路可保证快速的位置环。

Offset:
反向间隙、CEC补偿、需要计算，需要时间，无法放到驱动侧

对于840Dpl官方只能用于电机编码器。
驱动使用电机编码器，位置使用光栅。
但可以：
系统负责最后的精度，驱动负责动态性能。

这样在840Dsl上也这么用。
官方：可选择
转换系数：
电机编码器：2048 p/rev
传动比：MD31050=951869 MD31060=100000
丝杠螺距：1mm
光栅尺栅距：0.04mm
则：电机一圈：2048pulse
对应光栅尺的脉冲数：951869/100000*1/0.04
系数=2048/ (9.51869/0.04)

Assessment of Accuracy at Axes with different Dynamics (Circular Test)

Overview of the Procedure of an Optimization

Axis with constant velocity v :

$$\Delta x = x_{\text{set}} - x_{\text{Load}} = v \cdot \text{Delay Time}$$

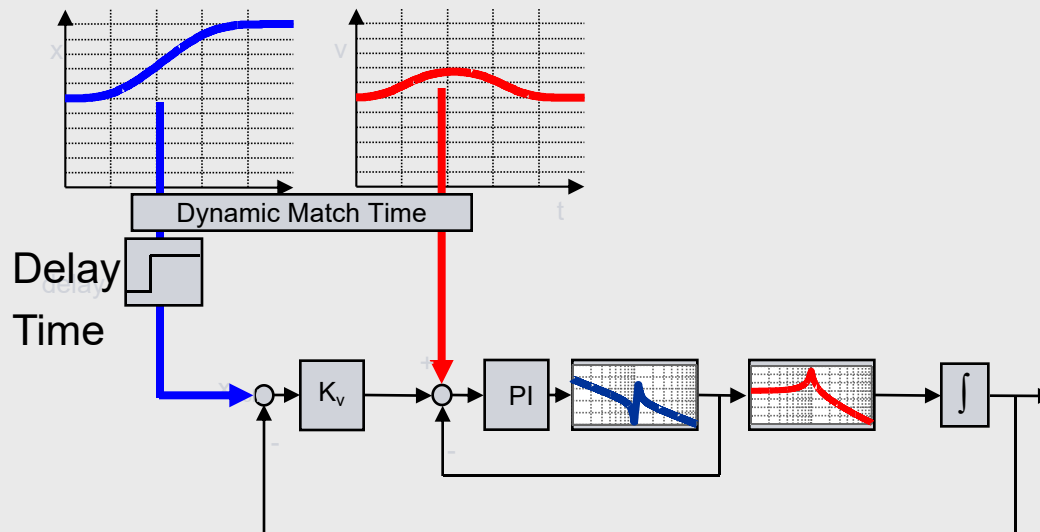

$$\text{Leading } K_v = 1/\text{Delay Time}$$

Example:

$$\text{Delay Time} = 4\text{ms}, v = 1\text{m/min} \Rightarrow \Delta x = x_{\text{set}} - x_{\text{Load}} = 66,7\mu\text{m}$$

$$\text{Leading } K_v = 1/4\text{ms} = 1/0.004\text{s} * 60\text{s/min} * \text{m}/1000\text{mm} = 15 \text{ [1000/min]}$$

**For interpolation the axes can have different Disturbance- K_v .
But all the axes must have same Leading- K_v (delay time)!**

Position Controller with Speed Feed Forward

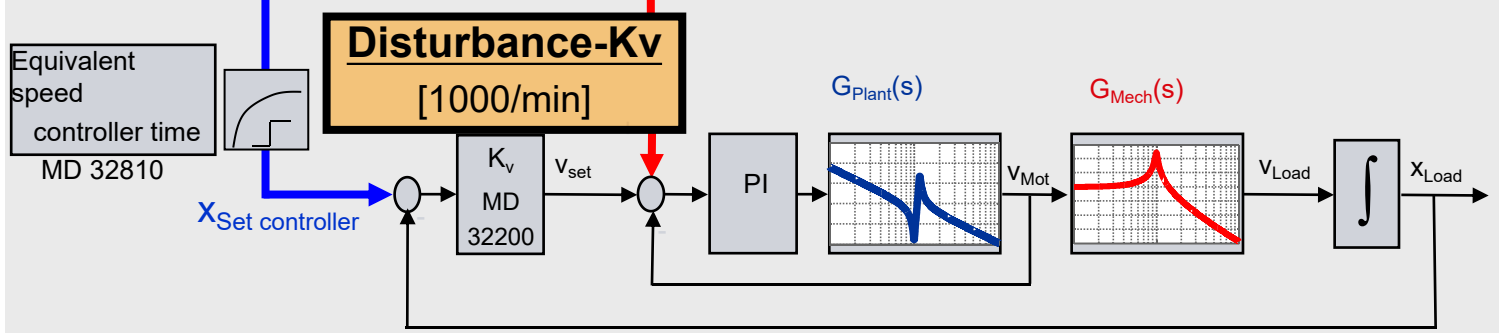

Commanded-Kv [1000/min] =

0,06 [s]

Equiv. speed controller time [s] + Jerk time[s] + dyn. match time[s] + desval delay [s]

Remark:
If Jerk Mode MD32402=2 (moving averaging)
Jerk time / 2 (only half time constant)

Assessment of Accuracy at Axes with different Dynamics (Circular Test)

Since the torque feed forward signal does not result in a movement in zero time, this structure would result in an overshoot in position. To overcome this effect, the setpoints for speed and position have to be delayed. The delay basically fits to the time that is needed to build the real motor current including current setpoint filter delay time.

Speed and Position Controller

Feed Forward

Acceleration Limitation

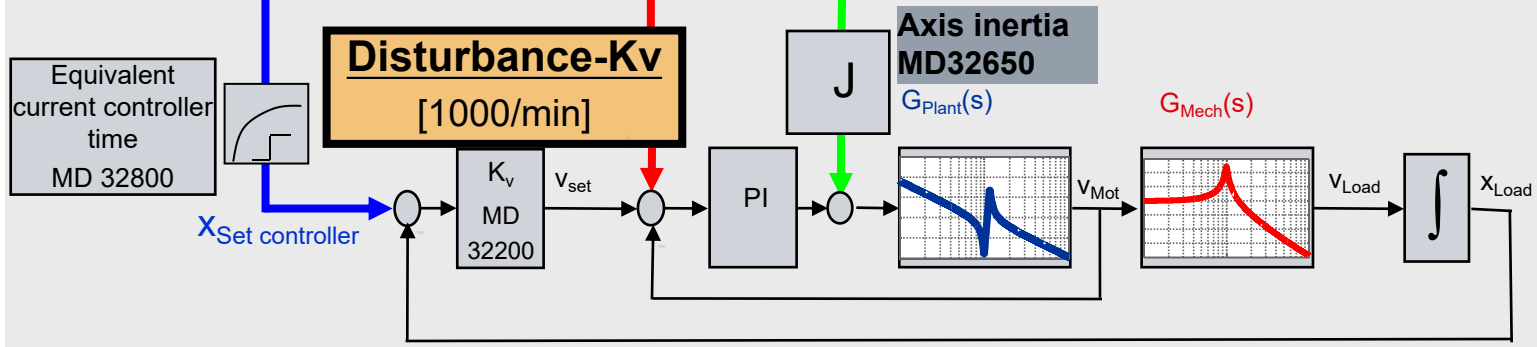

Jerk Limitation

Assessment of Accuracy at Axes with different Dynamics (Circular Test)

Overview of the Procedure of an Optimization

Remark:
 If Jerk Mode MD32402=2 (moving averaging)
 Jerk time / 2 (only half time constant)

Positioning with Infinite Acceleration ($a = \infty$) Only in Theory -> not Possible due to $F = m \cdot a$

无加速度限制($a = \infty$)的定位, 理论曲线→不可能, 因为 $F = m \cdot a$

优化过程

Presetting of different machine datas

Axis-MD 33000	FIPO_TYPE = 3	(Type of FIPO position setpoint)
Drive-MD 1004	CTRL_CONFIG = 1000H	(FIPO speed setpoint)

Measurements of the mechanical system

Ref. Frequency Response: „Speed Controller Plant“
 Ref. Frequency Response: „Mechanics“ (only possible with DMS)

Adjustment of Current Setpoint Filters

Ref. Freq. Resp. Of the closed speed controller (@ $T_N = 10$ ms K_p as high as possible)
 Maybe use of other software to find optimal filter setting

Optimization of Speed Controller

Step Response or Ref. Freq. Resp. Of the closed speed controller (optimal values for K_p , T_N and f_{Refmod})

Optimization of Position Controller Parameters

Ref. Frequency Response of the closed position controller loop (find optimal value for K_v)

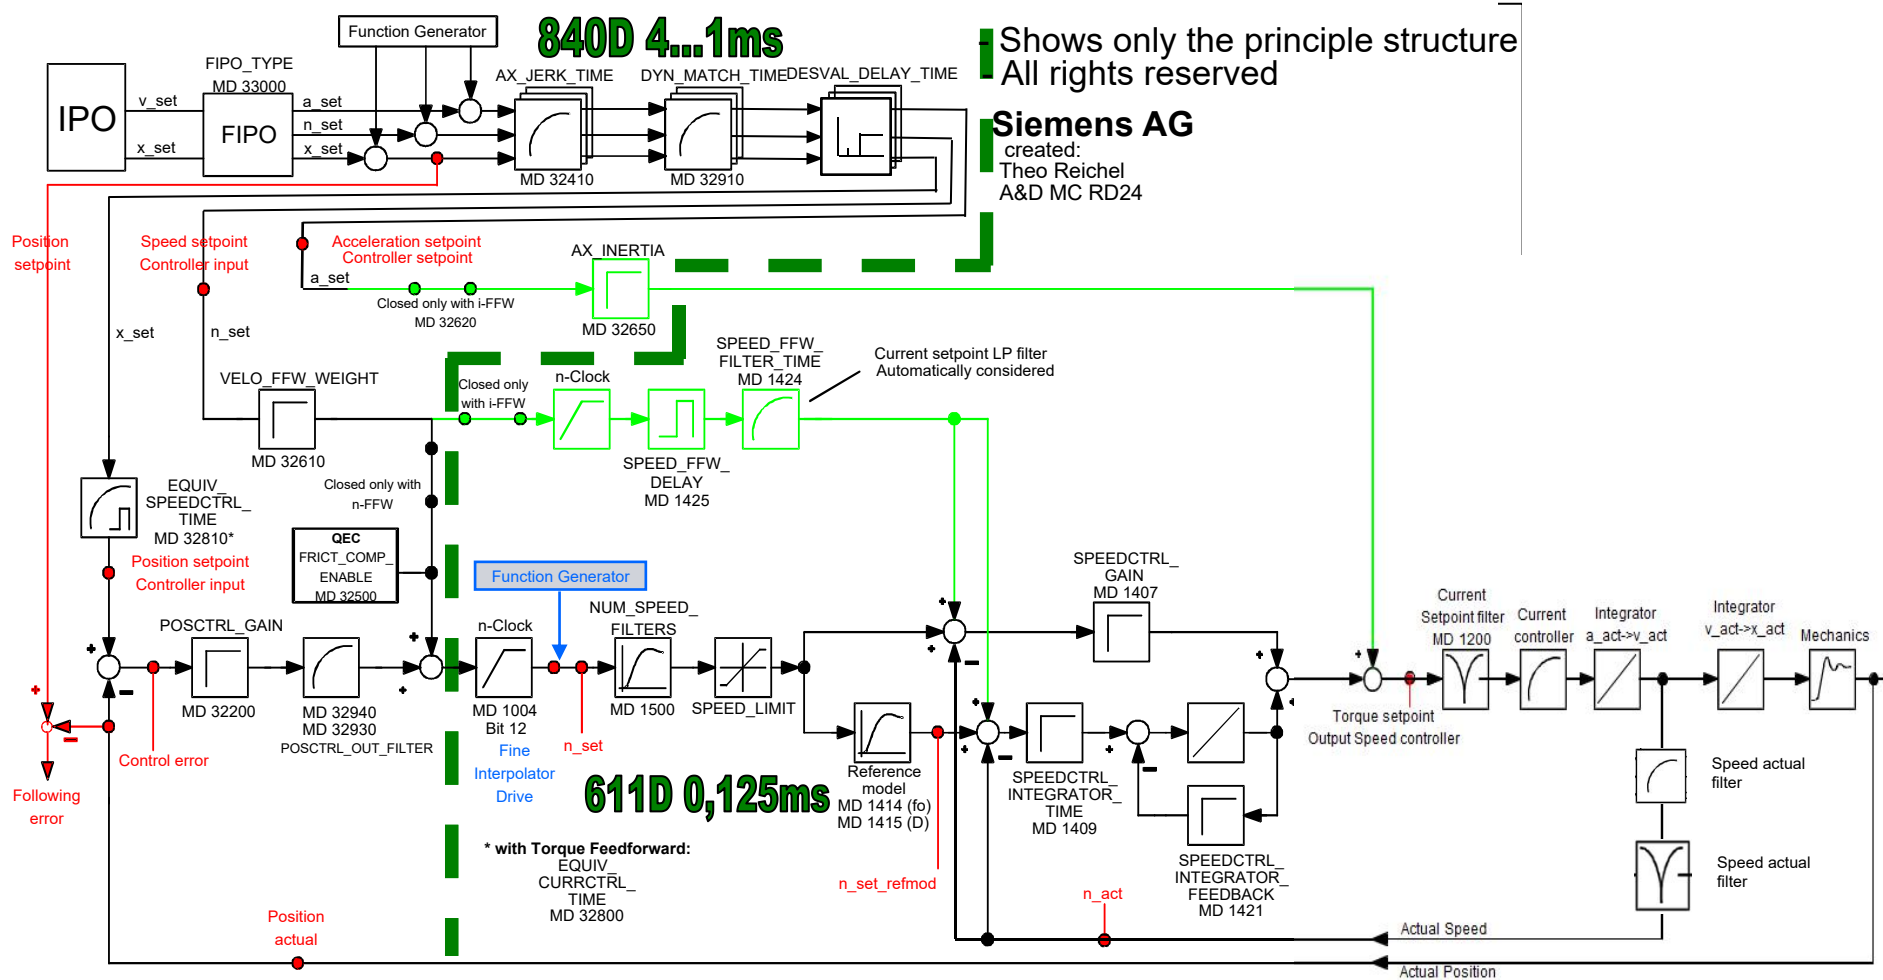

Activation and optimization of Speed Feed Forward

Positioning Behavior: „SERVO TRACE“ (FFW_MODE = 3; find optimal Value for Equivalent Speed Controller Time
 maybe finetuning with the Reference model)

Dynamics adjustment for different axes

„Circular Test“ (Mean Radius has to be the same as programed radius; optimal roundness)
